The fraction of computers that belong to networks is increasing all the time. And for a typical single computer, the fraction of its execution load, storage occupancy, and system management problems that are involved with being part of a network is also growing.

Computer Network Architecture is defined as the physical and logical design of the software, hardware, protocols, and media of the transmission of data. Simply we can say that how computers are organized and how tasks are allocated to the computer. The two types of network architectures are used:

Computer Network Architecture - javatpoint

Network architecture refers to the way network devices and services are structured to serve the connectivity needs of client devices. Network devices typically include switches and routers. Types of services include DHCP and DNS. Client devices comprise end-user devices, servers, and

Cisco Communications Theory

It's basically the physical and logical design which refers to the software, hardware, protocols and the media of transmission of data. Simply put, it refers to how computers are organized and how tasks are allocated among these computers. The two types of widely used network architectures are peer-to-peer aka P2P and client/server aka tiered.

Network Architecture: Types of Network Architecture - DEV

Network architecture is the design of a computer network. It is a framework for the specification of a network's physical components and their functional organization and configuration, its operational principles and procedures, as well as communication protocols used.

Protocol/Internet Protocol. TCP/IP is a set of layered protocols used for communication over the Internet. The communication model of this suite is client-server model. A computer that sends a request is the client and a computer to which the request is sent is the server. TCP/IP has four layers –

Network Protocols - Tutorialspoint

A network protocol includes all the rules and conventions for communication between network devices, including ways devices can identify and make connections with each other. There are also formatting rules that specify how data is packaged into sent and received messages.

Network architecture understood as the set of layers and layer protocols that constitute the communication system. Network architectures offer different ways of solving a critical issue when it comes to building a network: transfer data quickly and efficiently by the devices that make up the network.

Deep neural network architectures: (A) VGG-16 is a single image classifier, (B) SegNet is used for pixel-level image segmentation and labeling using an encoder-decoder type structure, (C) FuseNet developed for combining RGB and depth data, and (D) VNet is used for remote sensing data fusion of infra-red images and digital surface models.

Network Architecture - an overview | ScienceDirect Topics

The IP protocol is one of the fundamental protocols that allow the internet to work. IP addresses are unique on each network and they allow machines to address each other across a network. It is implemented on the internet layer in the IP/TCP model. Networks can be linked together, but traffic must be routed when crossing network boundaries.

Computer network - Wikipedia

The protocol is split into the following layers: physical (PHY) layer, medium access control (MAC) layer, radio link control (RLC) layer, packet data convergence protocol (PDCP) layer, and service data adaptation protocol (SDAP) layer. The main functionalities of these layers are briefly described now. Figure 2.1.

Protocol Architecture - an overview | ScienceDirect Topics

For those students who will continue in computer networking, it lays foundations of protocol design principles, secure network architecture and design skills, and experience with TCP/IP network management protocols, which are necessary to take more advanced courses in graduate study and/or technical training in the industry.
