Photoelasticity is one of the oldest methods for experimental stress analysis, but has been overshadowed by the FEM for engineering applications over the past two/three decades. The phenomenon was first observed by David Brewster in the early 19th century in glass and he foresaw the potential of ...

Analysis of surface morphology reveals that there are more craters at the tip of machined rods whereas, the area around the base is relatively smooth. Value of surface roughness varies from 1.6  $\mu\text{m Ra}$  to 6.3  $\mu\text{m Ra}$  under different experimental conditions. A variation in chemical composition is observed along the length of the rod.

The yielding transition in soft materials manifests macroscopically as a reversible transition from solid-like deformation to liquid-like flow under sufficiently large loading or deformation. Despite the ubiquity of materials that exhibit yielding, an understanding of the transition has remained elusive due to experimental limitations of the simple rheological tests typically used to study it ...

Expression Stability Analysis of 10 Candidate Reference Genes. The performance of 10 candidate reference genes in *I. indigotica* was assessed via qRT-PCR in different samples, which were divided into three experimental sets (total, tissues and stresses), five different tissues (roots, stems, leaves, flowers, and fruits), and three stress treatments (ABA, wounding, and cold).
