Immunoglobulins (IgA, IgM, IgG, IgD, IgE) are antibodies that play an important role in fighting infections. There are 5 different types of immunoglobulins in your blood, which scientists have named IgA, IgM, IgG, IgD, and IgE. Each of these has a slightly different role to play in your immune system.

IgG, IgM, IgA, IgE, and IgD are the five classes of immunoglobulins classified depending on the presence of five types of Fc regions. They are large, Y-shaped, glycoprotein molecules. Activated plasma cells synthesize these antibodies. Generally, their function is to bind to a specific epitope of a pathogenic antigen.
