Plant Parasitic Nematodes In The
Several plant-parasitic nematodes are associated with legume crops. The pea cyst nematode is an important parasite of peas and broad beans in many countries. The stem nematode is another important nematode on broad beans. Root-knot, cyst and reniform nematodes are the major nematode pests of chickpea and cowpea.

Plant Parasitic Nematodes : USDA ARS
Nematodes that feed on plant parts are called plant parasitic nematodes (PPN) and are ubiquitous in agricultural soils. The life cycle of a nematode includes eggs, juveniles and adults, and they can overwinter at any of these stages.

Plant Parasitic Nematodes Explained
Plant-parasitic nematodes occur in all sizes and shapes. The typical nematode shape is a long and slender worm-like animal, but often the adult animals are swollen and no longer even resemble worms (Figure 2). Plant-parasitic nematodes range from 250 um to 12 mm in length, averaging 1 mm, to about 15-35 um in width.

Plant parasitic nematodes feed on living plant tissues, using an oral stylet, a spearing device somewhat like a hypodermic needle, to puncture host cells. Many, probably all, plant nematodes inject enzymes into a host cell before feeding to partially digest

Nematodes that are parasitic to the plants in a garden tend to be very small and can often only be seen with a microscope. The shape of a plant-parasitic nematode's mouth, or stylet, is like a hypodermic needle that they use to puncture a plant's cells, injecting their own digestive juices and draining the plant fluids into their mouths.

The roughly 2,271 genera are placed in 256 families. The many parasitic forms include pathogens in most plants and animals. A third of the genera occur as parasites of vertebrates; about 35 nematode species occur in humans. Nathan Cobb, a nematologist, described the ubiquity of nematodes on Earth as thus:

However, plant-parasitic nematodes feed on plants; damaging roots, creating wounds which may serve as infection points for plant pathogenic fungi, and directly transmitting certain pathogens, such as viruses, to the host plant. Plant-parasitic nematodes have a needle-like stylet in their mouthparts which they use to feed on plant cells.

Plant parasitic nematodes may attack the roots, stem, foliage and flowers of plants. All plant parasitic nematodes have piercing mouthparts called stylets. The presence of a stylet is the key diagnostic sign differentiating plant parasitic nematodes from all other types of nematodes.
